

X-COM UFO Defense

Story

X-COM UFO Defense, or as it is also known, X-COM Enemy Unknown is a turn based strategy game published by [Microprose](#) in 1992. The storyline is as follows: Earth faces more and more incursions and reconnaissance missions by alien creatures whose purposes are not quite clear (in the beginning). An international project is founded, the X-COM. X-COM's mandate is to find out, what is behind the increasing visits by the aliens, and if necessary, to stop them.

History

The game is the first in a whole line of games, some not newer than a few months (now, in 2020). It is a well received game, that is however, notorious for putting players patience and tenacity to the test. Especially for beginners it sometimes feels just downright unfair, as under (literally) unfortunate circumstances, the random generator generates situations, that are difficult to master, even on easier level settings. As the original game is from 1992, the graphics looks accordingly old. Newer variations of the game of course changed its technical makeup but also adapted the game mechanics. But the basic principle of turn based strategy is one of the features, veteran players find the most significant reasons for its success.

Gameplay

The game is divided in two different settings. One is kind of a global surveillance, the so-called Geoscape, where you can monitor UFO activity within your radar installations reach. You can control the speed of in-game time passing. Whenever an event happens, the time is stopped, so that the player may chose some sort of reaction to that situation. This can be anything from finished production or research to UFO appearances, landings, alien attacks and the monthly report/assessment by the X-COM funding council.

The other setting is the so-called Battlescape, where the actual turn based strategy game mechanics applies. You can control a number of human soldiers as well as certain automated weapons platforms (kind of small tanks). Your mission types can be one of the following list:

- UFO landed somewhere on the globe, trying to carry out its mission. You attack. You can play this either with you own agenda (e. g. only take certain resources or captives, and leave) or you try and kill/neutralize all aliens and take the found items with you.
- A UFO crash landed after being shot down by one of your interceptor crafts. You attack. You can play this either with you own agenda (e. g. only take certain resources or captives, and leave) or you try and kill/neutralize all aliens and take the found items with you. In contrast to the landed UFO, you will encounter less enemy units on the map, and less items for recovery.
- Aliens attack a city directly, trying to kill all civilians there (terrorism). You defend them. If you fail, the funding council will take this badly and reduce their funding.
- Aliens attack your base. You defend your base. If you fail, you lose that base.

- An alien base is being attacked by you. You attack. You can either kill all units or destroy certain parts of the base and leave. If you fail, the base remains. If you succeed, the base is being removed from the game.

In any case, if you lose all your units, you lose the mission. Depending on the mission type, that can mean only losing scores and a transport craft. If you lose a base defense mission, you lose the entire base.

The aliens also have mission objectives, e. g.:

- Research,
- abduction,
- retaliation (find one of your bases and possibly attack it),
- terror,
- building or supplying one of their bases.

Goal

You can only win the game in one way. <spoiler> The end-game mission is a trip to mars, where you have to destroy the aliens controlling "brain". If you succeed, you win the game. If you fail this mission, you lose the game ultimately. </spoiler> You can lose the game in either one of the following four ways:

1. You lose all your funding nations.
2. You make a deficit of 1 Mio. twice (not necessarily twice in a row).
3. You lose all your bases.
4. See the spoiler above...

Research and Economy

In the beginning you start only with human technology, meaning normal rifles, pistols, rocket launchers, grenades and tanks. Same goes for your interceptors and transport craft, as well as their armament. While conducting recovery missions of crash landed UFOs and other missions you encounter different aliens, dead and alive, as well as numerous alien items, such as weapons or materials. Your scientists can do research on them, improving your situation by adding the alien military capabilities to your own, as well as improving base- and craft technology made by humans. Many researched items can then be produced by your engineers.

An important part is the selling of recovered and produced items. This also includes the ability to build new items and selling them afterwards. Certain items can be used as income leverage, making more expensive items from cheaper ones, or produce items investing only money. Especially in the beginning, money is scarce as the funding nations do not give you unlimited currency. So producing and selling have an important role in the game.

The money itself is spent on production jobs, your staff (soldiers, scientists and engineers), leased craft, and maintenance and extension of your bases. During each month you cannot have negative amounts of money. But if your expenses from base maintenance and salary of staff are higher, than your income + currently possessed money, you can end up with negative money after a month. If this

happens twice in a game, you lose it.

The research follows a predefined tech-tree. Some items unlock certain research, other research is unlocked by previous research results. Some research items are available right from the start. Some research items are necessary in order to win the game, other items are strictly prose, so they serve no actual in-game purpose.

An experienced player knows the intricacies and priorities of research, which makes the game easier, once you have played it at least on time to the end. This also allows to vary the game play by emphasizing some strategies or technologies more than other. But as described above, some research elements are a must in order to finish the game successfully.

Aliens

There are a number of different alien races the player may encounter. Those reign from “classic” small grey creatures to flying and mind controlling species. All of them have certain advantages and disadvantages. They are however, dangerous to varying degree. All of them are lethal when using their weapons on you, but some are more resilient or have other traits, that make them particularly dangerous.

Trivia

The game makes many references to pop culture, like the grey Sectoid aliens, of a material described as element 115. Also alien abductions and experiments on cattle are incorporated in the games story.
